

Assignment: Deploy PHP App Using Elastic Beanstalk

NAME: VIKRAM

Problem Statement

You work for XYZ Corporation. The company wants to launch a new **web-based application** that should **not have servers running all the time** and should be **fully managed by AWS**.

You are required to **implement a suitable managed solution**.

Tasks To Be Performed

1. Create an **Elastic Beanstalk environment** with the runtime as **PHP**.
 2. **Upload a simple PHP file** to the environment once created.
-

✓ Solution: Using AWS Elastic Beanstalk

Overview

AWS Elastic Beanstalk is a fully managed service that automatically handles environment provisioning, load balancing, scaling, and application monitoring.

You only need to provide your application code — AWS takes care of the infrastructure and scaling automatically.

□ Steps to Perform

Step 1 — Open Elastic Beanstalk

- Go to the **AWS Management Console**
 - Search for **Elastic Beanstalk**
 - Click **Create Environment**
-

Step 2 — Choose Environment Type

- Select **Web server environment**
 - Click **Select**
-

Step 3 — Configure Environment

Setting	Value
Application name	demo-php
Environment name	demo-php-env
Platform	PHP
Platform branch	Latest available (e.g., PHP 8.3)
Platform version	Default

Step 4 — Upload Application Code

1. Create a file named **index.php**.
 2. Open your text editor (like Notepad on Windows)
 3. Copy and paste the following code:

```
<?php
echo "Hello from XYZ Corporation!";
?>
```
 4. **Save the file:**
 - Go to **File > Save As**.
 - In the "File name" field, type **index.php**
 - In the "Save as type" field, choose **All Files**.
 - Click **Save**.
 5. Zip the file (make sure **index.php** is directly inside the zip, not within a folder).
Example file name: **index.php.zip**
 6. In Elastic Beanstalk:
 - Under **Application code**, select **Upload your code**
 - **Choose your php-app.zip**
 - Click **Next**
-

Step 5 — Configure Service Access

After clicking **Next**, Elastic Beanstalk will ask for **Service Access configuration**.

This allows Beanstalk to launch and manage AWS resources securely.

Configuration:

- **Service role:**
 - Choose **“Create and use new service role”**
 - (This will create a role named **aws-elasticbeanstalk-service-role** automatically.)

- **EC2 instance profile:**

Choose “Create and use new instance profile”

- (This will create a role named aws-elasticbeanstalk-ec2-role.)

☑ These roles allow Beanstalk to launch EC2 instances, access S3, and send metrics to CloudWatch.

- After verifying these options, click **Next** to proceed.

Step 6 — Set up networking

- Select VPC and subnet.
- Enable Public IP Address.
- Keep all the Default settings
- Click Next

Step 7 — Configure instance traffic and scaling

- Select the EC2 security group
- And keep all the settings default
- Review and Create Environment.

The screenshot shows the AWS Elastic Beanstalk console interface for the 'Create environment' wizard. The top navigation bar includes the AWS logo, a search bar, and the current region 'United States (N. Virginia)'. The breadcrumb trail shows 'Elastic Beanstalk > Create environment'. On the left, a vertical progress bar lists six steps: Step 1 (Configure environment, selected), Step 2 (Configure service access), Step 3 (optional: Set up networking, database, and tags), Step 4 (optional: Configure instance traffic and scaling), Step 5 (optional: Configure updates, monitoring, and logging), and Step 6 (Review). The main content area is titled 'Configure environment' and contains two sections. The 'Environment tier' section has two radio button options: 'Web server environment' (selected) and 'Worker environment'. The 'Web server environment' option includes a description and a 'Learn more' link. The 'Application information' section has a text input field for 'Application name' with the value 'demo-php' and a note about the maximum length of 100 characters.

○ Configure instance traffic and scaling

Step 5 - optional
○ Configure updates, monitoring, and logging

Step 6
○ Review

Configure environment [Info](#)

Environment tier [Info](#)

Amazon Elastic Beanstalk has two types of environment tiers to support different types of web applications.

☒ **Web server environment**
Run a website, web application, or web API that serves HTTP requests. [Learn more](#)

☐ **Worker environment**
Run a worker application that processes long-running workloads on demand or performs tasks on a schedule. [Learn more](#)

Review

Instance settings

Choose a subnet in each AZ for the instances that run your application. To avoid exposing your instances to the Internet, run your instances in private subnets and load balancer in public subnets. To run your load balancer and instances in the same public subnets, assign public IP addresses to the instances. [Learn more](#)

VPC

vpc-03af9fa3d1eb0c8bf | (10.0.0.0/16) | default vpc

Create VPC

Public IP address

Assign a public IP address to the Amazon EC2 instances in your environment.

☒ Enable

Instance subnets

Filter instance subnets

	Availability Zone	Subnet	CIDR	Name
<input type="checkbox"/>	us-east-1a	subnet-057506d411de73650	10.0.16.0/20	subnet1
<input checked="" type="checkbox"/>	us-east-1b	subnet-0c0f78808cbf67247	10.0.0.0/20	default subnet

Create environment

Instance metadata service (IMDS)

Your environment's platform supports both IMDSv1 and IMDSv2. To enforce IMDSv2, deactivate IMDSv1. [Learn more](#)

IMDSv1

With the current setting, the environment enables only IMDSv2.

☒ Disable

EC2 security groups

Select security groups to control traffic.

EC2 security groups

Choose security groups

Time	Type	Details
October 27, 2025 18:53:31 (UTC+5:30)	INFO	Environment health has transitioned from Pending to Ok. Initialization completed 52 seconds

Step 8— Environment Creation

- AWS will automatically:
 - Launch an **EC2 instance**
 - Create an **Auto Scaling Group**
 - Set up a **Load Balancer**
 - Configure **CloudWatch monitoring**

Wait around **5–10 minutes** for deployment to complete.

Once done, you'll see **“Health: Green”** on the dashboard.

Environment successfully launched.
